This is a long-transcript enriched cDNA library (Genome Res. 11: 1553-1558 (2001). [PMID: 1154199]) from WAO1 cell line. Undifferentiated human ES cell line WAO1/HI was obtained from WiCell Research Institute, Inc., Wadison, Wi, cultured according to their instructions, on MEF feeders. They formed according to their instructions, on MEF feeders. They formed colonies with defined edges and were positive for alkaline phosphatase, SSEA-4, OCT3, OCT4, REX1, UFF, TERT, SOX2, CX43 and CX45, They are negative for GATA2, GATA4, PDX1, NCAM, MSX1, FIT3, SSEA-1, TUBB3, NES, GFRP, and EDWES. When confluent (18-10 days after plating), the ES cells from 4 X 6cm dishes were treated with 1 mg/ml collagenase, type IV (Invitrogen/GIBCO) for 5-10 min and gently scraped off with 5 ml pipette. RNA was purified with TRIZOl Reagent from Invitrogen. Protocol ref: Genome Res. 11: 1553-1558 (2001). [PMID:11544199]) Double-stranded cDNA8 were synthesized with an Oligo(dT) primer [Invitrogen:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3.49 of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform extraction, and separated from fere linkers by Centricon-100 column. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S for 25 cycles. The products were purified by phenol/chloroform extraction and Centricon-100 column. The CDNAs were digested with Sal1 and NoII enzymes and cloned into Sal1/NotI site of pcWV-SPORTE plasmid vector. The average insert size is about 3.6kb."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /clone="IMAGE:30426593"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

hypothetical protein 18479.7
N.Alternate names: hypothetical protein 18479.7
S.Species: Saccharomyces cerevisiae
C.Species: Saccharomyces cerevisiae
C.Species: 05-May-1995 #sequence_revision 12-May-1995 #text_change 09-Jul-2004
C.Speciesion: S51398
S.Miller, N.
Submitted to the EMBL Data Library, November 1994
A.Specription: The sequence of S. cerevisiae cosmid 8479.
A.Reference number: S51395
A.Accession: S51398
